

## Level 2: Part 2

1- 6 inches =  $\frac{1}{6}$  of a yard

So the field is  $110 \cdot 80 \cdot \frac{1}{6} = 1466.66$  cu. yds

Cost of the gravel =  $(9.37)(1466.66) + \text{tax}$

$$= \$13,742.66 + (.0625)(13742.66)$$

= \$14,601.58 = Total gravel cost

How many truck loads are needed?

$$\frac{1466.66}{9} = 162.96 \approx 163$$

Trucking cost  $163 \cdot 25 = \$4075$

So 163 truck loads will be needed

& the total cost =  $14,601.58 + 4075$

\$18,676.58 or \$18,676.51, if you use ~~1466.66~~ 162.96 truck loads.

2- 11 regions

Both answers are ~~correct~~ acceptable.

2 (cont) You did not have to prove it is the correct answer, but we will do it anyhow. One line cuts the circle into 2 pieces.  $\textcircled{\frac{1}{2}}$ . Another line that crosses the 1st line, cuts piece 1 into 2 pieces & piece 2 into 2 pieces. So now there are 4 pieces.

Now

consider a line . It cuts

piece 1 into 2, piece 2 into 2 pieces & piece 3 into 2 pieces. Thus 3 pieces have to be added. For a total of 7 pieces.

Take a new line that meets all 3 of the old lines. Piece 1 is cut into 2 pieces, so is piece 2 & so is piece 6 (bad picture) & so is piece 7. So one have to add 4 pieces &  $7+4=11$ .  
 $n$  lines cut a circle into at most  $(n^2 + n + 2) / 2$  pieces

| prime | $\frac{1}{p}$ decimal                | period | smallest $k$<br>$p \mid 10^k - 1$ | period = $k$ |
|-------|--------------------------------------|--------|-----------------------------------|--------------|
| 3     | $\frac{1}{3} = 0.\overline{3}$       | 1      | $3 \mid 10^1 - 1$ $k=1$           | Yes          |
| 7     | $\frac{1}{7} = 0.\overline{142857}$  | 6      | $7 \mid 10^6 - 1$ $k=6$           | Yes          |
| 11    | $\frac{1}{11} = 0.\overline{09}$     | 2      | $11 \mid 10^2 - 1$ $k=2$          | Yes          |
| 13    | $\frac{1}{13} = 0.\overline{076923}$ | 6      | $13 \mid 10^6 - 1$ $k=6$          | Yes          |

Notice  $k$  does divide  $p-1$

b)  $k \mid 16$ , so  $k=1, 2, 4, 8, 16$

c)  $17 \nmid 10^1 - 1$     $17 \nmid (10^2 - 1)$     $17 \nmid (10^4 - 1)$     $17 \nmid (10^8 - 1)$

but  $10^{16} - 1$  is so large the calculator does not display it as an integer. But we conclude  $k=16$ .

d) My calculator give  $\frac{1}{17} = 0.0588235294$ , just 10 digits! We are going to have to divide by hand!  
or on another calculator I got

12 places  $\frac{1}{17} \approx 0.058823529412$

↑  
this is wrong!

$$\begin{array}{r}
 .0588235294117647 \\
 17 \overline{) 1.0000000000000000} \\
 \underline{.85} \\
 150 \\
 \underline{136} \\
 140 \\
 \underline{136} \\
 40 \\
 \underline{34} \\
 60 \\
 \underline{51} \\
 90 \\
 \underline{85} \\
 50 \\
 \underline{34} \\
 160 \\
 \underline{153} \\
 70 \\
 \underline{68} \\
 20 \\
 \underline{17} \\
 30 \\
 \underline{17} \\
 130 \\
 \underline{119} \\
 110 \\
 \underline{102} \\
 80 \\
 \underline{68} \\
 120 \\
 \underline{119} \\
 1
 \end{array}$$

So  $\frac{1}{17} = \overline{.0588235294117647}$

4- let  $x$  = number of \$1 coins  
 $y$  = # of quarters

$$x + y = 43$$

$$x + .25y = 29.50 \quad \text{so } x = 43 - y$$

$$\text{so } 43 - y + .25y = 29.50$$

$$-.75y = 29.50 - 43 = -13.5$$

$$y = \frac{13.5}{.75} = 18$$

$x = 43 - 18 = 25$ . so 25 \$1 coins &  
~~25~~ quarters. 18 quarters

5- Use the Pythagorean theorem. It states  
if the length of AC is  $b$ ; length of AB =  $c$   
& the length of CB =  $a$ , then  $a^2 + b^2 = c^2$ .

$$\text{The area of } A = \frac{1}{2} \pi b^2$$

$$\text{The area of } B = \frac{1}{2} \pi a^2$$

$$\text{The area of } C = \frac{1}{2} \pi c^2 \quad \text{so}$$

$$\frac{1}{2} \pi a^2 + \frac{1}{2} \pi b^2 = \frac{1}{2} \pi (a^2 + b^2) = \frac{1}{2} \pi c^2$$

5b)

Label the unshaded regions as above

$$\text{Area of } C = \text{area}(T) + \text{area}(W_1) + \text{area}(W_2)$$

$$= \text{area of } A + \text{area of } B = \text{area of } R_1 + \text{area of } W_1$$

$$+ \text{area of } R_2 + \text{area of } W_2. \text{ So}$$

$$\text{area}(T) + \text{area}(W_1) + \text{area}(W_2) =$$

$$\text{area}(R_1) + \text{area}(W_1) + \text{area}(R_2) + \text{area}(W_2)$$

$$\therefore \text{area}(T) = \text{area}(R_1) + \text{area}(R_2)$$
